

Specific Parts for the A3

The A3 upper receiver is also called the flattop receiver so if you're looking for parts for this receiver don't get confused by the different names. Although similar to the A3 the true M4 flattop receivers have additional feed ramp cuts aligned with the barrel extension feed ramps.

The major feature of the A3 upper is its integrated M-1913 Picatinny rail system. The Picatinny rails provide a solid and repeatable attachment point for all types of optics and accessories including a detachable carry handle with a rear sight assembly.

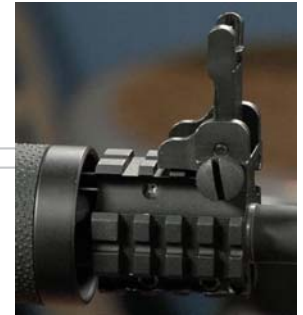

View of the feed ramps cut in the M4 receiver from the rear of the receiver. Barrel is not installed.

Standard Front Sight Base

With this mount system you have the choice of using a standard A2 front sight base or an alternative style gas block. If you choose an alternative gas block there are also flip up front sights that are calibrated to work with the detachable A2 carry handle or flip up rear sights.

You will only need the ejection port cover and forward assist assemblies along with a sighting system to complete the assembly of your upper receiver.

Combination of Picatinny Rail System & flip up front sight
